Instalação e carregamento dos pacotes necessários

Carregamento dos pacotes necessários ao funcionamento do script. Caso algum dos pacotes não esteja instalado, a rotina abaixo fará a instalação e o carregamento automaticamente.

Raspagem 1

A rotina abaixo irá acessar o código html do site onde estão hospedados os editais, retornando duas bases: a lista com os nomes e códigos dos órgãos do governo do Estado de Santa Catarina e a lista dos anos disponíveis para consulta.

```
url <- 'https://sistemas4.sc.gov.br/sea/portaldecompras/pesquisa_editais_p.asp?cdo=**CDO**'

lista_orgao <- read_html(url) %>% html_nodes('option')
orgao_cod <- lista_orgao %>% html_attr('value')
orgao_nome <- lista_orgao %>% html_text()

df_orgaos <- data.frame(orgao_cod, orgao_nome)
df_orgaos <- df_orgaos[3:75,]

lista_anos <- read_html(url) %>% html_nodes('select')
anos <- lista_anos[2]
anos <- anos %>% html_nodes('option') %>% html_text()
df_anos <- data.frame(anos)

df_anos <- df_anos[17,]
```

Raspagem 2

Com base na composição programática de unma lista de URLs, o script irá raspar o código html e irá capturaros parâmetros que, na sequência, mediante nova composição das URLs, irá acessar as páginas específicas de cada edital. Nestam mesma rotina, haverá como saída uma base de dados contendo informações específicas dos editais, como datas, órgãos e status.

```
tabela_url <- data.frame()
base_parametros_final <- data.frame()

for (a in 1:length(df_anos)) {
  ano <- df_anos[a]
  i <- 1
```

```

Tratamento de dados

As bases resultado da rotina acima terá seus valores convertidos para caracteres e a função `distinct()` removerá as linhas repetidas, se houverem. Ao final será impresso na tela o número de editais encontrados.

```
base_parametros_final <- base_parametros_final %>% mutate_all(as.character)
tabela_url <- tabela_url %>% mutate_all(as.character)

base_parametros_final <- base_parametros_final %>% distinct()
tabela_url <- tabela_url %>% distinct()

print(paste0('Total de Editais encontrados: ', nrow(base_parametros_final)))

## [1] "Total de Editais encontrados: 509"
```

Tratamento de dados

A base de parâmetros é composta por uma série de quatro informações: “portal”, “processo”, “editais” e “cdo”. Como resultado da busca, as quatro informações são capturadas dentro da mesma string. A rotina abaixo irá separar cada uma delas e uma coluna correspondente. Para a base de tabela com as informações dos editais é feito um tratamento no nome das colunas.

```
options(warn = -1)

Tratamento de dados

A raspagem da tabela de informações dos editais, retorna com uma pequena falha em algumas linhas, onde algumas informações estão setadas em colunas erradas. A rotina abaixo faz um ajuste nessas falhas. É criada uma nova coluna de id único, composta pelo número do edital concatenado com o código do órgão.

```

tabela_url$id <- gsub(pattern = ".*?([a-z]+).*", x = tabela_url$edital, replacement = NA)
tabela_url$id <- gsub(pattern = ".*?([A-Z]+).*", x = tabela_url$id, replacement = NA)
tabela_url <- tabela_url %>% filter(!is.na(id))
tabela_url$id <- gsub(pattern = '/', replacement = '', tabela_url$id)
tabela_url$id <- paste0(tabela_url$id, '_', tabela_url$cdo)

base_parametros_final$id <- gsub(pattern = '/', replacement = '', base_parametros_final$edital)
base_parametros_final$id <- paste0(base_parametros_final$id, '_', base_parametros_final$cdo)

for (i in 1:nrow(tabela_url)) {
  if (str_detect(pattern = ".*?([A-Z]+).*", string = tabela_url$entrega_de_proposta[i])) {
    tabela_url$entrega_de_proposta[i] <- tabela_url$docs[i]
    tabela_url$situacao[i] <- tabela_url$na[i]
  } else if (str_detect(pattern = ".*?([a-z]+).*", string = tabela_url$entrega_de_proposta[i])) {
    tabela_url$entrega_de_proposta[i] <- tabela_url$docs[i]
    tabela_url$situacao[i] <- tabela_url$na[i]
  }
}
tabela_url <- tabela_url[, -c(7, 9)]

```

Join entre as tabelas de parâmetros e a tabela de editais

Este join verifica os editais comuns entre as duas tabelas, gerando como saída uma nova base de parâmetros. Esta verificação é necessária para que, ao final do script, o Dashboard possa mostrar informações relativas aos editais, como datas, status e órgãos.

```
base_parametros_final <- semi_join(x = base_parametros_final, y = tabela_url, by = 'id')
```

Montagem de URLs

A rotina a seguir monta as URLs das páginas específicas de cada edital para, posteriormente, capturar o links para download dos documentos.

```
base <- 'https://sistemas4.sc.gov.br/sea/portaldecompras/docs1.asp?'
portal <- 'portal='
processo <- '&processo='
cdo <- '&cdo='
edital <- '&edital='

base_parametros_final$link_repositorio_edital <- NA
for (i in 1:nrow(base_parametros_final)) {
  print(paste0('Montando Link ', i, ' de ', nrow(base_parametros_final)))
  link_repositorio_edital <- paste0(base,
                                   portal, base_parametros_final$portal[i],
                                   processo, base_parametros_final$processo[i],
                                   cdo, base_parametros_final$cdo[i],
                                   edital, base_parametros_final$edital[i])
  base_parametros_final$link_repositorio_edital[i] <- link_repositorio_edital
}

Cria base final

A linha abaixo apenas atribui os valores da base de parâmetros a uma nova base de dados chamada de “base_final”.

```
base_final <- base_parametros_final
```

Tratamento de dados

A rotina a seguir cria duas novas colunas na tabela de informações de editais, contendo as datas de abertura e entrega de propostas tratadas no formato de dia/mês/ano. É feito ainda um join para a tabela final, que receberá os dados da tabela de informações de editais.

```
tabela_url$data_abertura <- str_sub(tabela_url$abertura, 1, 10)
tabela_url$data_entrega_proposta <- str_sub(tabela_url$entrega_de_proposta, 1, 10)

base_final <- base_final %>% mutate_all(as.character)
tabela_url <- tabela_url %>% mutate_all(as.character)

tabela_url <- tabela_url %>% distinct(id, .keep_all = TRUE)

base_final <- left_join(base_final, tabela_url, by = "id")

base_final <- base_final %>% distinct()

base_final$base_final[is.na(base_final$data_abertura)] <- NA
base_final$base_final[is.na(base_final$data_entrega_proposta)] <- NA
```

Raspagem 3

A rotina abaixo faz a raspagem das partes finais das URLs referente aos links dos editais para download.

```
base_final$final_url_edital <- NA
for (i in 1:nrow(base_final)) {
  repeat {
    print(paste0('Raspando link ', i, ' de ', nrow(base_final)))
    tmp <- try(lista <- (read_html(base_final$link_repositorio_edital[i]) %>% html_nodes('a') %>% html_
    base_final$final_url_edital[i] <- lista[1]
    print(base_final$final_url_edital[i])
    if (!(inherits(tmp, "try-error"))){
      break
    }
  }
}
```

Tratamento de dados

Cria a coluna `link_completo_para_editais` a partir da junção da URL base com a `final_url_ edital`, capturadas no rotina anterior. Faz ajuste nas colunas, com exclusão e mudança de nomes. Ao final salva o arquivo `base_final` em uma pasta de backups

```
base_final$link_completo_para_editais <- paste0('https://sistemas4.sc.gov.br/sea/portaldecompras/', base_
base_final <- base_final[, -c(8, 15, 16)]
base_final <- base_final %>% rename("edital" = "edital.x",
                                   "cdo" = "cdo.x",
                                   "orgao" = "orgao.x")

data <- str_replace_all(string = Sys.Date(), pattern = '-', replacement = '_')
write.csv(base_final, paste0('backup_bases/base_final_sem_conteudo_', data, '.csv'))
```

Download dos editais

A rotina abaixo fará o download dos editais para posterior leitura. Renomeia os arquivos no momento de salvar, setando com os valores da coluna id (número do edital concatenado com o código do órgão). Falhas de rede podem acontecer durante o download e com isso parar o script. Antes de efetuar o download, é verificado quais arquivos já estão na pasta. Com isso, caso o código pare, ao recommear não será necessário baixar novamente os arquivos que já estão na máquina (útil no caso de atualização da base).

```

Converte arquivos DOC em PDF

Não há uma padronização no formato dos arquivos disponíveis para download.

Assim, o trecho abaixo, que será executado no bash do Linux, usa uma funcionalidade

do LibreOffice para conversão de documentos.

Na sequência, a rotina move todos os documento em fomato DOC para uma pasta separada.

Não é possível executar o trecho abaixo diretamente no R.

É preciso executar o arquivo .sh, anexo neste projeto, em um terminal bash do Linux.

É necessário o LibreOffice instalado

comando: `bash /caminho_do_arquivo/doc_to_pdf.sh`

Leitura do conteúdo dos editais

A rotina abaixo faz a leitura do conteúdos dos editais em PDF e salva na base_final. Ao final salva a base em uma pasta de backup.

```
lista_pdf <- list.files(path = 'arquivos_downloaded/pdfs/', pattern = '*.pdf', full.names = TRUE)

lista_pdf <- sort(lista_pdf, decreasing = FALSE)
base_final <- base_final %>% arrange(id)

base_final$conteudo_edital <- NA
base_final$id_arquivo <- NA
for (i in 1:length(lista_pdf)) {
  base_final$conteudo_edital[i] <- str_flatten(pdftools::pdf_text(pdf = lista_pdf[i]))
  base_final$id_arquivo[i] <- lista_pdf[i]
  print(paste0("Carregando conteúdo do Edital ",i, ' de ',length(lista_pdf)))
}
```

```

print(paste0("ID: ",base_final$id[i], ' - ',str_remove(string = lista_pdf[i], pattern = 'arquivos_down
})

```
